No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                          ABP73884;
RESULT 1
```

```
The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion or replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, continity of a gene product, preferably enzymatic activity, carbon cativity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an essential candida albicans protein essential movention. Note: The sequence data for this patent is not represented in the printed the printed the printed the printed the printed the printed of the printed the printed the printed the printed of the printed the printed the printed of the printed the printed of the printed the printed of the printed the printed the printed the printed of the printed the printed the printed of the printed the printed of the printed print

```
by chromosome 2 of the human malarial parasite, plasmodium falciparum.
Also described are: (1) nucleotide sequences (11) encoding (1): and (2) vaccines against P. falciparum infection comprising (1) or (11).

(1) and (11) are useful for the development of vaccines against P. falciparum infection. (1) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (1), are useful in the detection of infection with P. falciparum. Furthermore, (1) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       parts of the world, and there is a pressing need for vaccines and new introgs. AAA70078 to AAA70287 and AAB18144 to ABA18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              63 KNVISLVALKRD----YLS---LSLSNNKQIKKFKNIKN-----KHLKNKFNLYVINEDI 110

                                                                                                                                                                                                                                                                                 This sequence represents the rggL protein from Streptococcus gordonii which is used in a method which identifies and isolates a salt-inducible promoter (SIP). Using this SIP, salt can be used as a food-grade inducer in food fermentation processes, e.g. in the production of cheese, dressings, water-containing spreads, sausages, or sour dough.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for maintaining mammalian haematopoietic progenitor cells (HPC) in vitro by maintaining the cells in a nutritive medium comprising a placental glycoprotein hormone of the murine prolactin family. The prolactin hormone can be either murine prolactin-like protein E (MPLP-E; the present sequence) or murine prolactin-like protein E (MPLP-E). The method is useful for maintaining and inducing proliferation, differentiation or both of mammalian haematopoietic progenitor cells in vitro into megakaryocytes and for inducing mammalian megakaryocytes into platelets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          55 VILDKYDLK-----NVISLVALKRDYLSLSLSNNKQIKKFKNIKNKHLKNKFNL-- 103

The present invention relates to ERA binding domain polypeptides (AAG99559-AAG99989 and AAM00010-AAM00021). The era gene in Escherichia coli codes for an essential GTPase protein able to autophosphorylate at serine and/or threonine residues. The protein has potential antimicrobial and antibacterial activity and is useful in screening for antagonists, agonists and for compounds with antibiotic activity. The proteins are also useful in determining their role in pathogenesis of infection, dysfunction and disease and could be used as part of a vaccine and/or
                                                                                                                                                                                                                                                                                                                                     LKNVISLVALKRDYLSLSLSNNK--QIKKFKNIKNKHLKNKFNLYVINEDIEKRITKNGI 119

                                                                                                                                                                                                                                                                                                                                                                                                          P
                                                                                                                                                                                                                                                         ò
```

The invention relates to a recombinant entomopox virus (EPV) vector

```
comprising a polynucleotide encoding a protein operably linked with a heterologous promoter sequence. The invention also concerns methods for providing gene therapy for genetic deficiency disorders. Vectors of the invention are useful for delivering a polynucleotide encoding a protein to a vertebrate cell preferably a mammalian cell, such as a human cell. The vector is introduced into the vertebrate cell by infection in a viral particle, or by transfection, transduction, or injection either in viro or in vivo. The vector is useful for the delivery and expression of biologically useful proteins in gene therapy protocols, and for delivering large DNA segments for engineering of vertebrate cells. Polynucleotides of the invention have applications in techniques such as their use as insertion sites for foreign genes of interest, hybridisation production of sense or antisense nucleic acids, vectors of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     281
                                                                                                                                                                                                                                                                       provide for stable integration and expression of heterologous DNA in host cells, and are adapted for accepting large heterologous polynucleotide inserts which can be delivered in an infected or transformed cell and expressed in a stable fraction. The current sequence represents the amagine moorei entomopoxvirus (AmEPV) poly(A) polymerase large subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -----KQIKKFKNIKNKHL--KNKFNLYVINEDIEKRI 114

The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion or expression of the sacond allele is regulated by the promoter. So that expression of the second allele is regulated by the promoter. (MI) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virtlence and/or pathogenicity of a fungus, a gene that is easier to the virtlence and/or pathogenicity of a fungus, and for identifying a pere transpending a gene transpending a pere transpending a gene product, preferably enzymatic activity, carbon capending, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, compound having the activity, and entitle activity and entitle for identifying a compound having the entitle of a susful for identifying a compound having the activity. The method is useful for identifying a compound having the activity. The method is useful for identifying a compound having the activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an essential candida albicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by
Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19 SGSIHLEKVKQ------GYL

The nucleotide sequences may be used to identify functionally similar genes in other mycete species, and may also be used as a probe to screen a C. albicans genomic library. The genes and polypeptides may also be used to identify fungal infections. The new method of screening for antimycotic substances using essential genes or proteins allows the identification of drugs which will only inhibit growth of specific mycete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the expression of the target essential Candida albicans or Aspergillus fumigatus genes or inhibit the activity of essential proteins from these species. This method is particularly useful for screening for inhibitors of 7.8 dihydro-6 hydroxymethylpterin-pyrophosphokinase (HPPK) and/or dihydropteroate synthase (DHPS). The method may also be used to identify antimycete substances acting on other mycete species. These inhibitors may be used to treat infections caused by these organisms or may be used prophylactically to prevent infection in immunosuppressed individuals.
                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the protein encoded by the Candida albicans captured agene. The invention relates to eight nucleotide sequences representing essential C. albicans genes, and the polynucleotides that they encode. An antibody against the polypeptides, and a method for screening for antimycotic substances using one of the essential genes or the peptides encoded by them as a target is also included in the invention. The method may be used to screen for substances that inhibit

                                                                                                                                                                                                                                                                                         The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              10 EFDENLSSSSGSIHLEKVKQNCSPNYDYFKITFIDGY----LYIKNKSGVILDKYDLKN 64
                                                                                                                                                                                                                                                                                                                                         (1) and (11) are useful for the development of vaccines against antibody raised to immunogens comprising the sequences of (1), are useful in the detection of infection with P. falciparum. Furthermore, (21) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in F. falciparum Squencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a yeast Scel endonuclease. The endonuclease hydrolyses the phosphodiester bond of a polynucleotide chain. The endonuclease is the 50 kba subunit of a yeast endonuclease. The endonuclease gene was modified so that it could be mass-produced in an expression system such as E. coli or yeast. The endonuclease polynucleotide sequence was modified by substituting codons that are unique to mitochondria (the gene is expressed in mitochondria) with universal codons. The endonuclease cuts molecules within sequence AA237078, and is therefore useful in genetic engineering techniques such as PCR (polymerase chain reaction) for cloning,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -- LKNVISLVALKRDYLSL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chromosome 2; human malaria parasite; vaccine; protozoacide; infection; insecticide.

```
The present invention describes proteins and their fragments (1) encoded by chromosome 2 of the human malarial parasite, plasmodium falciparum. Also described are: (1) nucleotide sequences (II) encoding (I): and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) and the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in the falciparum sequencing of the Plasmodium chromosome 2 and the subsequent identification of the Plasmodium chromosome 2 and the complexity of the parasitic lifecycle, and provide new targets for complexity of the parasitic lifecycle, and provide new targets for complexity of the parasitic lifecycle, and provide new targets for resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new construction and protein sequences given in the present invention, but which are not specifically mentioned within the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   89 FKNIKNKHLKNKFN-LYVINEDIEKR-----ITKNGILEEVILNKMLL---- 130

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by computer, so that expression of the second allele is regulated by the promoter. So that expression of the second allele is regulated by the promoter. And is useful for constructing a strain of diploid fungal cells in which both alleles modified as easeful for identifying a gene that is sesential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian containing. (A) a second in the proportion of a mammalian containing the proportion of a mammalian containing the proportion of a mammalian containing the proportion of the proportion of the mammalian containing the proportion of the proportion of the proportion of the mammalian containing the proportion of the proportion of the proportion of the mammalian containing the proportion of the pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1750 ELKQAHGELDFLKKHLENQREDSEAIKTELNQSKMSTSFDIRDQQKLRNELLVTKEENFS 1809

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ------FKITFIDGYLY------IKNKSGVILDKYDLKNVISLVALKR 73
Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an essential Candida albicans protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1810 LVKTNKELNLKVSDLEEKLYSNEQLKYWESKVDTLSKALDGALNEKHEADKTIKNLQRSI

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           68 FAISSESQLSLLKLKETHV-----NN--LQSYKKVLKKHL------QKIRRLLKKD 110

This sequence represents a polypeptide that is critical for the survival and growth of Candida albicans. The C. albicans nucleic acid molecules encoding the polypeptides of the invention may be used as probes and primers for detecting homologous nucleic acid molecule sequences. The polypeptides and nucleic acid molecules and compounds identified as selectively modulating the expression of the polypeptides, may be used as medicaments or for the preparation of a medicament to treat Calbicans associated diseases, especially in AIDS patients and to treat vulvovaginitis in otherwise healthy females. The use of the polypeptides and polynuclocide sequences to treat Calbicans associated diseases has fewer side effects and less toxicity than previously used methods such as the use of amphotericin. This method is therefore especially suitable for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Essential polypeptides isolated from Candida albicans, useful in the treatment of diseases caused by C.albicans, especially in immunocompromised subjects, e.g., AIDS patients

Patent No. 6562958
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: BAUMANNI FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
